SUMMARIES

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                             The sequence represents the mouse antibody 21.6 light chain variable region directed against leukocyte adhesion molecule VLA-4. Cloned CDNA sequences of mouse 21.6 V and VII (see AA099892) regions are linked to human constant regions in the construction of a humanized antibody against VLA-4. The 5' and 3' ends of the mouse cDNAs are modified using PCR Primers (See AA099895-98) and then subcloned into mammalian cell expression vectors containing human kappa or gamma-1 constant regions. In the humanized light chain, amino acids L45, by the amino acid present in the equivalent position of the mouse 21.6 If Chain, Plasnids encoding the chimeric antibodies are

                                                                                                                                                                                                                                                                                                                                                                 21.6 Ig L chain. Placemids encoding the chimeric antibodies are transfected into COS cells. The humanized antibodies are to inhibit adhesion of a leukocyte to an endothelial cell and to treat inflammatory diseases such as multiple sclerosis. They can also be used in the treatment of stroke, cerebral traumas, amoningitis or encephalitis. The antibodies can also be used for anti-idiotype antibodies.

chain variable region against leukocyte adheaion molecule VLA-4.

Cloned cDNA sequences of mouse 21.6 VL (AAQ99889) and VH (AAQ99892)

regions are linked to human constant regions in the construction
of a humanized antibody against VLA-4. The 5' and 3' ends of the
mouse CDNAs are modified using PCR primers (See AAQ9989-98) and
then subcloned into mammalian cell expression vectors containing
human kapa or gamma-1 constant regions. In the humanized light
chain, amino acids L45' L49' L58 and L69 in the human kapa LC VR
framework are replaced by the amino acid present in the equivalent
position of the mouse 21.6 IJ Lohain. Plasmids encoding the
conforthelial cell and to treat inflammatory diseases such as
multiple sclerosis. They can also be used in the treatment of
stroke, cerebral traumas, meninglits or encephalitis. The
antibodies can also be used for detecting VLA-4, for affinity
purification or for generating anti-idiotype antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 MRPSIQFLGLLLFWLHGAQCDIQMTQSPSSLSASLGGKVTITCKTSQDINKYMAWYQHKP 60
humanised 21.6 VL (see AAM22412) and a claimed humanised 21.6 antibody that is used in the manufacture of a medicament for treating a disease selected from asthma, atherosciarosis, AIDS, dementia, diabetes, inflammatory bowel disease, rheumatord arthritis, transplant rejection, graft versus host disease, tumour metastasis, nephritis, atopic dermatitis, psoriasis, myocardial ischaemia, and acute leukocyte mediated lung injury. The antibody may also be used in the affinity purification of alpha 4 integrin for use as a vaccine or an immunogen. It is also useful for generating idiotypic antibodies. The humanised antibodies of the invention have a half-life in the human circulation essentially equivalent to that of naturally occurring human antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ø
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          - by

This polypeptide, designated La, comprises the light chain variable region (VL) of a humanised alpha-4 integrin antibody 21.6 (see also AMM22412). It is composed of complementarity determining regions from the VL region (see AMM2240) of mouse alpha-4 integrin monoclonal antibody 21.6 and a modified human REI framework. It can be expressed in mammalian host cells following PCR amplification and munanised 21.6 VL and a humanised 21.6 VH (see AMM22413) can be used to produce a claimed humanised 21.6 antibody that is useful in the manufacture of a medicament for treating asthma, atherosofaciosis, arthritis, diabetes, inflammatory bowel disease, theumatoid arthritis, transplant rejection, graft versus host disease, tumour metastasis, nephritis, archiology dermatitis, psoriasis, myocardial cantibody has a half-life in the human circulation essentially equivalent to that of naturally occurring human antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 GKRPRLLIHYTSALQPGIPSRFSGSGSGRDYSFNISNLEPEDIATYYCLQYDNLWTFGGG 120

The sequence represents the mouse anti-VLA-4 antibody 21.6 light chain variable region (without signal sequence). Cloned cDNA CDR sequences of mouse 21.6 variable light and variable heavy regions are linked to human constant framework regions of the REI antibody for the light chain and the 2*CL antibody for the heavy chain in the construction of a humanized antibody against VLA-4. The 5' and 3' ends of the mouse cDNAs are modified using PCR primers (See AA09895-98) and then subcloned into mammalian cell expression vectors containing human kappa or gamma-1 constant regions. In the humanized light chain, amino acids L45, L49, L58 and L69 in the human kappa LCVR framework are replaced by the amino acid present in the equivalent position of the mouse 21.6 Ig light chain. Plasmids encoding the chimeric antibodies are transfected into COS cells. The humanized antibodies can be used to inhibit adhesion of a leukcoyte to an endothelial cell and to treat inflammatory diseases such as multiple sclerosis. They can also be used in the treatment of stroke, cerebral traumas, meningitis or encephaltiis. The antibodies can also be used for detecting VM-4, for affinity purification or for generating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       21 DIQMTQSPSSLSASLGGKVTITCKTSQDINKYMAWYQHKPGKRPRLLIHYTSALQPGIPS 80

The present invention describes fusion proteins comprising a chemokine and a tumour antigen or HIV antigen. Specifically claimed fusion proteins comprise: (1) human monocyte chemotactic protein-3 (MCP-3) and human Muc-1; (2) human interferon-induced protein 10 (IP-10) and human Muc-1; (3) human interferon-fuduced protein 10 (IP-10) and human Muc-1; (4) human SPF-1 and human Muc-1; (5) human IP-10 and HIV gpl20; (6) human MCP-3 and HIV gpl20; (7) human MDC and HIV gpl20; and (8) human SPF-1 and HIV gpl20; The fusion proteins, and nucleotide sequences encoding them, can be used for producing an immune response, e.g. an effector T cell immune response. They can also be used for treating cancer or treating or preventing HIV infection. The fusion proteins and/or nucleotide sequences for identifying unknown tumour antigen epitopes and fine mapping of them in without antigen epitopes and fine mapping of them in which is the contact the contact antigen and fine mapping of the company of the contact antigen and the mapping of the contact antigen and the mapping of the contact antigen antigen and the mapping of the contact and the contac
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             tumour antigen epitopes. The present sequence represents a fusion protein from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New fusion polypeptides comprising a chemokine and a tumour antigen or HIV antigen, used for treating cancers or treating or preventing HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    17 GAQCDIQMTQSPSSLSASLGGKVTITCKTSQDINKYMAWYQHKPGKRPRLLIHYTSALQP 76

The present invention describes fusion proteins comprising a chemokine and a tumour antigen or HIV antigen. Specifically claimed fusion proteins (Comprise: (1) human monocyte chemotactic protein-3 (MCP-3) and human Muc-1; (2) human interferon-induced protein 10 (IP-10) and human Muc-1; (3) human macrophage-derived chemokine (MDC) and human Muc-1; (4) human SDF-1 and human Muc-1; (5) human IP-10 and HIV gpl20; (6) human MCP-3 and HIV gpl20; (7) human MCC and HIV gpl20; and (8) human SDF-1 and HIV gpl20. The fusion proteins, and nucleotide sequences encoding them, can be used for producing an immune response. G.g. an effector T cell immune response. They can also be used for treating cancer or treating or preventing HIV infection. The fusion proteins and/or nucleotide sequences can be used in in vitro diagnostic assays, as well as in screening assays tumour antigen epitopes. The present sequence represents a fusion protein has nreash; invention
                                                                                                                                                                                                                                                                           New fusion polypeptides comprising a chemokine and a tumour antigen or HIV antigen, used for treating cancers or treating or preventing HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           17 GAQCDIQMTQSPSSLSASLGGKVTITCKTSQDINKYMAWYQHKPGKRPRLLIHYTSALQP 76

                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes fusion proteins comprising a chemokine and a tumour antigen or HIV antigen. Specifically claimed fusion proteins comprise: (1) human monocyte chemotactic protein.3 (WCP-3) and human Muc-1; (2) human interferon-induced protein 10 (IP-10) and human huc-1; (3) human macrophage-derived chemokine (MDC) and human Muc-1; (4) human SDF-1 and human Muc-1; (5) human IP-10 and HIV gpl20; (6) human Muc-3 and HIV gpl20; (7) human MC and HIV gpl20; and (8) human SDF-1 and HIV gpl20. The fusion proteins, and nucleotide sequences encoding them, can be used for producing an immune response, e.g. an effector T cell immune response. They can also be used for treating cancer or treating cancer o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                New fusion polypeptides comprising a chemokine and a tumour antigen or HIV antigen, used for treating cancers or treating or preventing HIV

Hybridoma antibodies have been produced with the spleen cells of BALB/c mouse that had received multiple injections of mercuric ions reacted with glutathione to produce a mercuric ion coordinate covalent compound which was covalently bound to keyhole limpet hemocyanin (KLH). Eight hybridomas (IFIO, 4A10, ICII, SG4, 2878, 2D5, 5D6 and 3E8) were producing MAbs that were strongly positive spainst glutatione-mercuric ions but negative against glutathione without mercuric ions. RNA was isolated from hybridoma cells with quanidine isothiocyanate. First strand cDNA synthesis was catalysed by Mulv reverse transcriptase. The primers used for cDNA synthesis of the chain expressed by the hybridoma of interest, or to the 5' and of the C kappa domain. Some of the primer used for cDNA synthesis are shown in AA097511-097518. The primer used for cDNA synthesis of the crimiale region of a particular antibody polypeptide was also used for PCR amplification of that variable region, in conjunction with an appropriate V-region primer. In addition, the VH primer AA097518 was used to amplify the mAb 2D5 and 5D6 heavy chains. The sequences of the PCR amplified nucleotides were determined. These are given on hand a handoy180-0878071. The descriptions of the SEQ ID nos given on pp 44-45 and in the claims are different from the descriptions in the sequence listings are
                                                                                                                                                        New polypeptide(s) which bind heavy metals, esp. mercury - derived from monoclonal antibodies, used for detecting, removing, adding or neutralising heavy metals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 DIQMTQSPSSLSASLGGKVTITCKASQDINKYIAWYQHKPGKGPRLLIHYTSTLQPGIPS 60

```
This polypeptide, designated La, comprises the light chain variable region (VL) of a humanised alpha-4 integrin antibody 21.6. It is composed of complementarity determining regions (CDRs) from the VL region (see AAW22409) of mouse alpha-4 integrin monoclonal antibody 21.6 and a modified human REI framework. It can be expressed in mammallan host cells following PCR amplification and mutagenesis of appropriate fragments of mouse and human DNA sequences. The humanised 21.6 VL and a humanised 21.6 vM (see AAW22413) can be used to produce a claimed humanised 21.6 antibody that is useful in the manufacture of a medicament for treating asthma, atherosclerosis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence encodes the humanized mouse antibody 21.6 light chain variable region, La, directed against leukocyte adhesion molecule variable region, La, directed against leukocyte adhesion molecule vLA-4. Cloned cDNA sequences of mouse 21.6 VL and WH (AAQ99889 and AAQ9982) regions are linked to human constant regions in the construction of a humanized antibody against VLA-4. The 5' and 3' ends of the mouse cDNAs are modified using PCR primers (See AAQ9985-98) and then subcloned into mammalian cell expression vectors containing human kappa or gamma-1 constant regions. In the humanized light chain, amino acids L45, L49, L58 and L69 in the human kappa LC VR framework are replaced by the amino acid present in the equivalent position of the mouse 21.6 Ig L chain. Plasmids encoding the chimmeric antibodies are transferded into COS cells. The humanized antibodies can be used for inhibiting adhesion of a leukocyte to an endothelial scall of treating inflammatory diseases such as multiple cerebral traumas, meningitis or encephalitis. The antibodies can also be used for detecting VLA-4, for affinity purification or for generating anti-idiotype antibodies.

                     The antibody
arthritis, transplant rejection, graft versus host disease, tumour metastasis, nephritis, atopic dermatitis, psoriasis, myocardial ischaemia, and acute leukocyte mediated lung injury. The antibody may also be used in the affinity purification of alpha-4 integrin for use as a vaccine or an immunogen. It is also useful for generating idiotypic antibodies. The humanised antibody has a half-life in the human circulation essentially equivalent to that of naturally occurring human antibodies.

                                                                                                                                                                                                                                                                                                       The present sequence is that of the variable region of the kappa light chain from murine monoclonal antibody K20. The antibody recognises the beta I subunit (CD29) of integrins and inhibits activation and proliferation of peripheral T cells induced by anti-cD3 antibodies. Monoclonal antibody K20 is a preferred target for humanisation; the humanised version may be useful as an immunosuppressant. In the humanisation process, the complementarity determining regions (CDKS) of a human antibody with framework regions 70-95% homologous to those of K20 were replaced by the K20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         12..29

The sequences given in AAR26982-3 contain part of the exotoxin A sequence corresponding to positions 252-613 of the full exotoxin A sequence. These sequences are encoded by FV(FRE)-FTA fusion genes. The ETA sequence was used as a marker gene so that E. coli transformed expressed in E. coli and the antibodies were extracted. These recombinant antibodies can be used for the qualitative and quantitative determination of c-erbB-2. This can be used for monitoring or in-vivo localisation of tumours overexpressing c-erbB-2.
                                                                                                                                                               Recombinant antibodies directed to growth factor receptor C-erbB-2 for diagnosing and treating tumours expressing C-erbB-2 e.g. breast

According to the Pre Publication Rules, every patent application received by the United States Patent and Trademark Office after November 29, 2000 will be pre-published at eighteen months from the effective filing date. When the application is published the contents, including the sequences, will become prior art.

Two new databases have been created to hold the pre-published sequences:

Published_Applications_NA contains nucleic acid sequences; the search results will have the

Published_Applications_AA contains amino acid sequences; the search results will have the

Each pre-published application is given a unique Publication Number. An example of a Publication Number is US20021234567A1. The "US" indicates the application was a U.S. application. The first 4 digits show the calendar year the application was published. The next 7 digits represent when the application was published. This 7-digit number starts at zero at the beginning of each calendar year. Each application published is given the next number in order. The "A" indicates a utility patent application and the "1" shows that this was the first time the application had been published. If the applicants submit changes to the application, they may requests that the changed application be published again. In such instances, the "1" at the end of the number would be replaced by a "2".

Sequences in the PGPub database are public information; it is permissible to leave these
